

Andy. . . and company. . .

The initial information I was given claimed that Wormwood/PX/Nibiru was 60 X Jupiter's mass and was orbiting on an ellipsoid pattern oriented at 90 Degrees to the Ecliptic plane. With a 3657 year orbit pattern, that would place most of its orbit track on the southern side of the ecliptic with a small portion of its perihelion maneuver up above the ecliptic on the northern side. Its Node of Right Ascension (where it cuts up through the ecliptic from the southern side to the northern side of the ecliptic) would be about halfway between the orbital track of Jupiter and the main asteroid belt. . . about 3.95 or 4.00 AU from the Sun. . . roughly. At that point it should be prominently visible in the May, June, July and August night time sky. Its orbit pattern would look something like this:

http://www.millenniumprophecy.com/Image_Gallery.html

And its perihelion maneuver would look something like this:

http://www.millenniumprophecy.com/Wormwood_Animation.html

The first problem was which side of the solar system was it coming inbound on? Dr. Robert Sutton Harrington had approximated an answer for that by tracing the orbital perturbations of Uranus. With 330,000+ computer simulations on an IBM system he established that the odds were 5:1 that Wormwood/PX/Nibiru was approaching the ecliptic from the southern side somewhere between RA 14 and RA 21. . . but probably closer to RA 16 (or its vicinity). Dr. Harrington's paper is still available on the Internet (as far as I know).

The Revelation (Ch 8) had described Wormwood/Bitterness as a "star". Astronomers had figured out that stars tended to orbit in pairs. The more recent plasma based astronomy indicates that stars are actually formed as binary pairs in the early days of the formation of most new solar systems. The estimates vary from about 65% to 75% of stars are binary pairs.

Brown dwarf stars were theorized to exist by Dr. Jill Tarter (Cornell Univ.) back in 1975. NASA found out that brown dwarf stars did in fact exist in 1982 but they kept that information secret. Then in 1992 the existence of brown dwarf stars became public complements of Dr. Maria Teresa Ruiz (Univ. of Chile, Santiago). And sure enough, brown dwarf stars had alkaline atmospheres. So The Revelation (Ch 8) descriptions of "Wormwood/Bitterness" throwing alkaline chemicals around turned out to be true. Generally all brown dwarf stars have alkaline atmospheres.

Then NASA launched the WISE satellite with its articulating Infrared optics. From 2009 to 2011 it mapped the entire sky several times in the infrared spectrum. The data it sent back showed that brown dwarf stars were more numerically significant than previously thought and they constituted about 16.66% of the stars floating around out there. Between the red dwarf stars (73%) and the brown dwarf stars (16.6%), the sky is DOMINATED on a NOSE COUNT BASIS by the smaller stars. . . roughly 92% of the stars gave off no visible light or very dim red light. So when you look out on a clear night and the stars look so bright and such, remember that you are only seeing about 8% of what's really out there floating around in space. With the naked eye you can't see most of what's there. To see the red dwarf stars you need the "big rig" equipment. And to see the brown dwarf stars, you need near infrared (NIR)

equipment.

As more information came in, it became apparent that Wormwood/PX/Nibiru could not come in at 60 X Jupiter's mass. The Abundance Ratios of the Elements would not permit such a thing. But then it would also be true that as a "chip off the old block" from the Sun itself, the Sun would have to be a solid body and the whole fusion power model of the Sun was wrong. As it turned out, Wormwood/PX could only be up to 1.1 X Jupiter's diameter so that placed an upper bound on its size. At 1.2 X Jupiter's diameter, it would be a Red Dwarf star and would become visible with a dim red glowing photosphere. Wormwood's atmosphere does not have such a glow, so it HAS to be smaller than the Red Dwarf stars.

So in the end, the Sun's binary companion star had to be about Jupiter's diameter and mass give or take a nickle or two. But Jupiter is QUITE LARGE and VERY HEAVY. It also has a VERY LARGE magnetic field. . . because of the iron content in its composition. The same would be true of Wormwood/PX/Nibiru. It would have to be about 300 X Earth's mass and diameter. So in the end, the description of Wormwood is that of a brown dwarf star about Jupiter's size and mass with a strong magnetic field and an alkaline atmosphere. And if it was anything like the other brown dwarf stars in the WISE survey it would have a surface temperature about 700 to 800 Degrees F.

With a 3657 year periodicity, Wormwood is the shaper of Earth's continents and the destroyer of Earth's civilizations. And the timing of the 3-D dance of the planets would mean that some of its perihelion maneuvers would be extremely destructive to the Earth and some of its maneuvers would be less so. As it turns out, with about every 4th trip through town, Wormwood is maximally destructive. Wormwood's appearance during the Great Flood of Noah (5300 +/- BC) was one of those max destruction events. It's trip through town during the Exodus of the Israelites from Egypt (1640 +/- BC) was much less destructive. Its next trip through the solar neighborhood will be bad enough but will not be one of the maximum destruction events like the Great Flood trip was. The Revelation describes the next set of effects that Wormwood will have in chapter's 6, 7, 8 and 16. It is not going to be pleasant but it won't be a complete wipe out of civilization either.

For a little bit broader description of the Wormwood periodicity you might want to read the essay I posted at the Millennium Prophecy website, The Wormwood Clock. Here's the link:

http://www.millenniumprophecy.com/Current_Commentary.html

If you guys are interested, Sheldon has copies of my prediction for the next "planetary perturbation". He can send you those solar system diagrams. Depending on the timing of Wormwood's next appearance, it looks like Saturn will be the next planet suffering from an off track condition as it approaches RA 18. I'm not sure how astronomers are going to make excuses for the new and unexpected "dip" in Saturn's orbit but maybe they will come up with something. . . any excuse other than PX/Wormwood/Nibiru. They really don't like PX/Wormwood. It messes up some of their pet theories. It doesn't seem to want to cooperate with politicians or astronomers. It's a funny thing about brown dwarf stars. They don't much care what your opinions or theories are. They just do what they do. Hmmm. . . Imagine

that... Anyway, Sheldon, see if you can find those two emails with the Saturn prediction in them.

That's about it for now. There is a lot of material on the Millennium Prophecy website with pics, the perihelion Animation, prophecy info and recorded live Interviews. The Interviews are not edited except for removing some commercials. All my spoken mistakes are recorded for everyone to listen to "as is". The later interviews have more accurate conceptual info than the earlier interviews. The Coast to Coast interview with George Noory in June, 2009 was the one that grabbed a lot of attention and seemed the most scary. Some of it was pretty intense.

That's enough for now. Let me know if you have any other questions. I will answer them the best that I can. . . computer data permitting.

Regards,

Gill Eriksen
