

Prof. JAMES McCANNEY:

"Leaks are coming out all over the place . . . Professional astronomers and military types are reporting that `a mini-solar system is moving into our Solar System.' "

http://thelightofdayradioshow.com/archives/shows2/Dinando_CD-2_09.mp3

JD: This means that a massive gravitational/magnetic dwarf star has captured many thousands of space bodies in deep space, and this baby sun is being gravitationally pulled into our Solar System by our own adult Sun's superior gravitational force field. As this celestial beehive cruises in, above Earth's orbital path, Earth will gravitationally suck in many of the celestial bees (meteors and smaller bolide [bullet-like] boulders, etc.) swarming within a radius of many millions of miles around their parent mini-sun, this incoming dwarf star, which NASA has, for decades, called "Planet X."

THE WASHINGTON POST frontpage: NASA Discovers the Long-Sought "Planet X"

In their 1983 WASHINGTON POST report, they tried to conceal the identity of this dwarf star, captured within the outer bounds of our Sun's gravitational force field. They claimed, "We Don't Know What It Is!" However, earlier that same year, they emphatically declared that they knew exactly what it was that they were launching their Infrared Astronomical Satellite to find: They announced that they were seeking "Planet X."

NASA, we are not stupid. We know that earlier you announced your space search for "Planet X," even though you later feigned ignorance when you found precisely what you had announced you were seeking.

THE NEW YORK TIMES: "Clues Get Warm in the Search for PLANET X"
