

NASA is minimizing their show of fear in this report on their new space project. Certainly, they want to prevent public panic. However, those of us whose expression is not politically restrained must work together to publicize astronomical evidence to convince the people that they must begin to store food, water, essential oils, germicidal silver, etc. in the event that meteors or even an asteroid impacts Earth and billions survive the impact, only to slowly die of hunger, thirst, disease, asphyxiation, and inter-human conflict.

NASA will never ever warn people, because their careers are more important than saving lives. Don't you agree that that is an accurate appraisal of most professionals' behavior, and not a cruel accusation?

However, we who have been studying the intrusion of comets and asteroids into our inner Solar System have much established evidence of this growing and inescapable reality; therefore, it is our responsibility to humankind to enlighten people as to their need for self defense preparedness in light of (or in the celestial and political darkness of) these increasing hordes of comets, asteroids, and meteors.
