

## NASA's Incoming "Planet X" to Pull Earth Into Deadly Elliptical Orbital Pattern

Astronomy researcher Gilbert Eriksen has determined that Planet X, intruding from deep space, is approaching Earth's Ecliptic plane near the current position of Saturn. This incoming dwarf star, which N.A.S.A. calls "Planet X," will soon be close enough to Saturn that it will pull that giant planet slightly out of its normal orbital path. God designed the Solar System so that Saturn and Jupiter normally exert just the right amount of gravitational pull on Earth to keep us in a safe circular orbital path around the Sun, with annual seasonal temperatures which are tolerable for sustaining life. However, when one of those two shepherding giants, Saturn, is pulled off-duty, Earth's orbital pattern will become somewhat elliptical, causing Earth to swing farther from the Sun during one season of the year, and closer to the Sun during the other season, resulting in extremely cold and hot annual temperature excursions, which could kill off all life on Earth.

Off course [misspelling intended], God also designed our Solar System so that this dwarf star [which N.A.S.A. calls "Planet X"] comes in and gravitationally pulls on Earth and the other planets every 36 1/2 centuries, at such a time when God determines that mankind's evil machinations have exceeded the point of any redemption, and are corrupting the condition of biological life (due to the evil Elite's bio-chemical chimerical perversion of life's genetic structure) irreversibly toward extinction.
