

BILL COOPER SHOKI WAVE SHOW AIRED
4-5-01 Re: Mad Cow Disease

BILL COOPER BX from Thur., 4-5-1

"This is a WORLDWIDE EXCLUSIVE on the Hour Of The Time. If you go to our Internet site right now, williamcooper.com, you'll see it as the lead story just posted about an hour ago. No one else has this story, but by tomorrow, the whole world is gonna know. The COVERUP of MAD COW DISEASE in the U.S. is beginning to self-destruct. Tonite I'm going to give you the proof of what I've been telling you all along."

According to a State of Colorado DNR Division of Wildlife letter, TRANSMISSIBLE SPONGIFORM ENCEPHALOPATHY, in Europe known as MAD COW DISEASE is RAMPANT, RAMPANT in the Mule Deer, White-tail Deer and Elk population of COLORADO, WYOMING and NEBRASKA and we have that letter in our possession. I'm going to read it to you right after I give you the pertinent portions of this story that you need to know. Beginning as of tonite, there's no longer any doubt that MAD COW DISEASE IS IN THE U.S. and has been here for a long time. The very same disease in humans is called Creutzfeldt-Jakob disease. It is always fatal in animals and humans reducing the brain to a spongy mass over the period of infection.

According to our confidential sources, Colorado State University at Ft. Collins has been experimenting with injecting animals, deer, pronghorn, and elk with the disease. I can't prove it but I believe that some of the animals may have escaped quarantine and contaminated the whole area over a long period of time. The University is located in Glacier View, Northwest of Ft. Collins.

For the last couple years, hunters have been required to cut off the heads of the deer, put a tag on them and drop it in barrels that have been placed at intersections of highways around the mountains. The Division of Wildlife then tests the heads of the animals, promising to notify the hunters if the meat is infected within 6-weeks. If the hunter doesn't hear from the DOW in 6-weeks, they are to ASSUME that the meat is okay, but ladies and gentlemen, some families who ate the meat after not hearing from the Div. Of Wildlife after 6-weeks were notified after 8-weeks that the meat WAS CONTAMINATED and there's a good chance that these people may be carrying the disease in an incubation period that can't be as long as 10-years!!!!

When hunters send their deer to a meat processor it is mixed with all the other carcasses. There is no way to monitor this as the deer bodies are brought in fresh. Processors can't hold a deer carcass for over 6-weeks B4 processing! They don't have those kind of storage facilities and/or freezers.

To COVERUP the TRUE NATURE of the disease in Colorado, it has been called CWD or CHRONIC WASTING DISEASE. The problem has become so serious that now the Division Of Wildlife has been FORCED to tell the truth calling for a public meeting on April 7th, 2001 to ask for the public's help in reducing the deer population by 50% in an effort to reduce spread of the disease.
